Phishing Awareness Quiz

Name: _____ Date: _____

1. An email says your account closes in 30 minutes. What should you do first?

A. Click immediately
B. Reply for confirmation
C. Pause and verify through the official app/site
D. Forward it to colleagues

2. Which sender detail is most important to inspect?

A. Logo
B. Display name
C. Full email address and domain
D. Signature colours

3. SPF passes for an unfamiliar domain used by a phisher. What does that prove?

A. The brand sent it
B. That domain authorized the sending server
C. The link is safe
D. The email is harmless

4. A link says microsoft.com but hover preview shows another domain. What is the safest conclusion?

A. The text is trustworthy
B. It is safe because HTTPS appears
C. The mismatch is a phishing warning
D. Open it in private mode

5. What should you do with an unexpected invoice attachment?

A. Open it to check
B. Confirm independently with the sender using known contact details
C. Enable macros
D. Upload it publicly

6. Why is a mismatched Reply-To suspicious?

A. It changes the font
B. Replies may be redirected to an attacker
C. It improves delivery
D. It proves encryption

7. Which is the correct way to check a suspicious URL?

A. Click and close quickly
B. Copy it into social media
C. Inspect/defang it and use approved scanning tools
D. Send it to a friend

8. An email passes SPF, DKIM and DMARC but asks for urgent wire-transfer changes. What next?

A. Pay immediately
B. Trust authentication alone
C. Verify by calling a known number
D. Reply with bank details

9. After accidentally entering a password on a suspicious page, what is best?

A. Wait for symptoms
B. Delete browser history
C. Contact security immediately and change it through the official site
D. Keep it secret

10. Why should employees report phishing before deleting it?

A. To preserve evidence and help protect others
B. To receive advertisements
C. To increase storage use
D. It is not necessary

Answer Key and Learning Points

1. C. Pause and verify through the official app/site
Pause and use an official channel; urgency is a reason to slow down.

2. C. Full email address and domain
The complete address and registrable domain reveal the real sending identity.

3. B. That domain authorized the sending server
SPF only authorizes the server for the tested envelope domain; it does not validate a displayed brand.

4. C. The mismatch is a phishing warning
Visible link text is attacker-controlled; a different hover destination is a major warning.

5. B. Confirm independently with the sender using known contact details
Unexpected attachments should be verified with the sender through independently known contact details.

6. B. Replies may be redirected to an attacker
A different Reply-To can redirect the conversation to an attacker.

7. C. Inspect/defang it and use approved scanning tools
Inspect and defang the URL, then use approved reputation or sandbox tools without visiting it.

8. C. Verify by calling a known number
Authentication can pass for compromised or attacker-controlled infrastructure; verify payment changes by phone.

9. C. Contact security immediately and change it through the official site
Fast reporting and a clean-route password change reduce the impact of credential exposure.

10. A. To preserve evidence and help protect others
Reporting preserves evidence and lets defenders remove related messages from other inboxes.

Suggested scoring

9–10: strong awareness · 7–8: satisfactory · 5–6: refresher recommended · below 5: repeat training and coaching.
